# System Landscape for the New App

# Service Design for New App

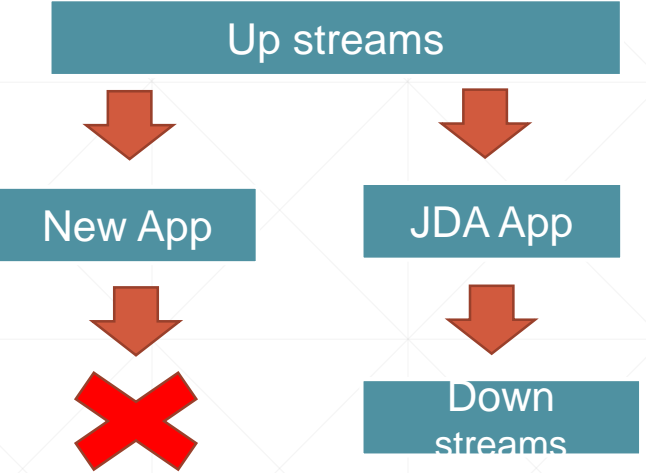

New Planning UI

API Gateway

# Cutover Approach

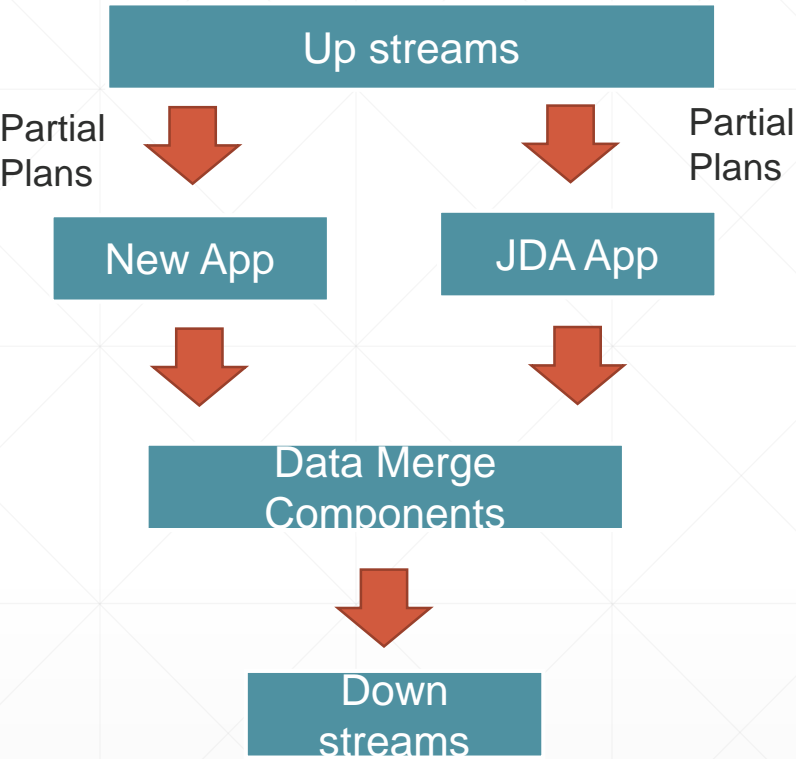

## STAGE 1

## STAGE 3

## STAGE 2

# Key Cutover Considerations

- **Need to ensure Planogram Builder supports both template and SSPOGs**
  - **Need to ensure Planogram Builder supports both Major and Minor ranging events**
  - **Need to ensure Floor plan automation engine supports both regular and essential space changes**
  - **Cutover activities should be harmonized with ranging events**
  - **Data migration scripts to be built to capture historic ranging events and plans**
-

# Key Cutover Considerations

- **Need to build Data transformation components to consolidate outbound interfaces to avoid disruption to down streams during cutover**
  - **Need Data anti corruption layers to prevent planning from both systems for same events**
  - **Translation components for floor plans across both new and old systems need to be built as they would exist in both systems during planogram cutover**
-
